                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                         The invention relates to peptidomimetic compounds (AAY77415-Y77438)
C capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4 mediated CL leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and callograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, and crestoness. Prior art inhibition of VLA-4/CS-1 interaction either immunor response on repeated administration, or the JS-mar CS-1 pentide and interaction can be response on repeated administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                            immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences AAY77411-Y77414 and AAY77434-Y77444 represent fragments of the CS-1 peptide tested for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fibronectin; FN; CS-1; endothelial cell; VLA-4 integrin; alpha-4-beta-1; CD49d/CD29; leukocyte; inflammatory cell; inflammation; cell adhesion; inhibitor; peptidomimetic; autoimmune disease; inflammatory disorder.

                                                                                                                                                                                                                                           which contain the CS-1 domain. The novel compounds inhibit cell adhesion, and consequent or associated pathogenic processes mediated by VLA-4, and may therefore be useful in the treatment and prevention of inflammatory, autoimmune, or respiratory disorders. These include asthma, arthritis, psoriasis, multiple sclerosis, transplant rejection, diabettes, and inflammatory bowel disease. Sequences AAY69618-Y69620 represent peptides derived from the VLA-4-binding domain of the FN CS-1 region which contain the LDV motif and are known to inhibit fibronectin-dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel arylalkyl and arylureidoalkyl azolylalkanolc acid derivatives and related compounds (I), and their salts and prodrugs. These are are integrin inhibitors, specifically of VLA-4 (very late antigen 4, also known as alpha-4-beta-1 or CD49d/CD29), which mediate cell adhesion. VLA-4 is a receptor for the cytokine-inducible cell surface protein VCAM-1 (vascular cell adhesion nolecule-1) and for the alternatively spliced forms of fibronectin (FN)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               VLA-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LDV peptide: VLA-4 inhibitor; very late antigen; alpha-4-beta-1; CD49d/CD29; cell adhesion; arylalkyl azolylalkanoic acid derivative; arylureidoalkyl azolylalkanoic acid derivative; inflammatory disorder; autoimmune disorder; respiratory disorder; LDV motif.

                                                                                                                                                                            end-stage renal disease, chronic diabetic nephropathy, diabetic glomerulopathy, diabetic renal hypertrophy, hypertensive nephrosclerosis, hypertensive glomerulosclerosis, chronic glomerulonephritis, hereditary nephritis or renal dysplasia. Sequences AAB73464-AAB73466 represent peptides derived from the VLA-4 binding domain (CS-1 region) of fibronectin, which inhibit fibronectin dependent cell adhesion, and may therefore be used in the method of the invention.
                                                                                                                                                                                                                                                                                           alpha-4-subunit containing integrins or antagonists of alpha-1 subunit-containing integrins. In particular, the antagonists are antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-4-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and laminin in the case of VLA-1, and fibronectin and VCAM-1 in the case of VLA-4). The method of the invention may be used to treat chronic renal failure,
                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for treating a mammal with, or at risk of developing, chronic renal failure, involving the administration of at least one integrin antagonist. The integrin antagonists that may be used in the method include antagonists of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB73465
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating a mammal in, or at a rifailure, involves administering

                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                     bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (1) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-MAY-1999;

At least 1 portion of the polypeptide is prepared crecombinantly or at least 1 heptad repeat in the series has a different camino acid sequence to other heptad repeat in the series. The CC polypeptide is useful in the construction of structural models which are cuseful for evaluating structure and activity of a selected occupied and collustered transmembrane protein having the selected cytoplasmic domain cand for identifying therapeutic compounds. It is also useful for cidentifying agents as inhibitors of alpha4 integrin biological compounds are constructural model with paxillin or a cresponse by contacting the structural model with paxillin or a constitution of a constitution of a post in the presence of a test agent candidates that the test agent is an inhibitor of alpha4 integrin constitution of a

It is also useful for identifying a cytoplasmic domain binding partner it is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation,
                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a peptide with a series of heptad-repeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to
                                                                                                                                                                 Fibronectin CS1-derived peptide #34.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CC CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of CC the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on CC the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an CC important role in the maturation and trafficking. VLA-4-mediated CC leukocyte adhesion to the CS-1 FN of endothelial cells is also a CC critical step in the inflammatory response. The peptidomimetics of the CC invention may be used to treat both chronic and acute immunoinflammatory CC conditions, such as asthma, rheumatoid arthritis, osteoarthritis and CC allograft rejection. They may also be used to treat psoriasis and other CC (e.g., multiple sclerosis), allergies, a therosclerosis, colitis, CC diabetes, inflammatory bowel diseases of the central nervous system CC (e.g., multiple sclerosis), allergies, a therosclerosis, colitis, CC diabetes, inflammatory bowel disease, kidney inflammation and CC restenosis. Prior art inhibition of VLA-4/CS-1 interaction either CC involves the use of anti-VLA-4 antibodies, which can themselves induce an CC (e.g., make and ostily to make and is subject to rapid proteolytic CC degradation. The peptide and therefore less expensive to comparison to the CS-1 peptide and therefore less expensive to comparison to the CS-1 peptide and therefore less expensive to comparison and are resistant to proteolysis. Sequences ANY77411-Y77414 and ANY77434-Y77444 represent fragments of the CS-1 peptide tested for CC (ANY77410).

conditions, such as asthma, rheumatoid arthritis, osteoarthritis and callograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, diabetes, inflammatory bowel disease, kidney inflammation and restensis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and costly to make and is subject to rapid proteolytic degradation. The peptidemimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide
                                                                                                                                                                                                                                                                                                                                             The invention relates to peptidomimetic compounds (AAY77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD49d/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoniflammatory

                                                                                                                                                                          endothelium and into tissues. It acts by blocking the alpha4-betal extracellular matrix receptor. Admin. of the peptide can suppress the immune response and treat diseases associated with chronic or relapsing activation of the immune system, including collagen vascular diseases and other autoimmune diseases, multiple sclerosis, asthma, allergy and chronic inflammatory skin conditions.
                                                                                                                                                                                                                                                                       The peptide is derived the CS-1 peptide (Humphries et al., 1987, J. Biol. Chem. 262:6886-6892), from the IIICS variable region of fibronectin. The peptide inhibits binding of lymphocytes to endothelial cells preventing migration through the vascular endothelium and into tissues. It acts by blocking the alpha4-

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
